Research Paper - Final (shubhangi kadam).docx

File Size
78.5 KB

16 Pages

4,505 Words

25,810 Characters

*% detected as AI

AI detection includes the possibility of false positives. Although some text in this submission is likely AI generated, scores below the 20% threshold are not surfaced because they have a higher likelihood of false positives.

Caution: Review required.

It is essential to understand the limitations of AI detection before making decisions about a student's work. We encourage you to learn more about Turnitin's AI detection capabilities before using the tool.

Disclaimer
Our AI writing assessment is designed to help educators identify text that might be prepared by a generative AI tool. Our AI writing assessment may not always be accurate (i.e., our AI models may produce either false positive results or false negative results), so it should not be used as the sole basis for adverse actions against a student. It takes further scrutiny and human judgment in conjunction with an organization's application of its specific academic policies to determine whether any academic misconduct has occurred.

Frequently Asked Questions

How should I interpret Turnitin's AI writing percentage and false positives?
The percentage shown in the AI writing report is the amount of qualifying text within the submission that Turnitin's AI writing detection model determines was either likely AI-generated text from a large-language model or likely AI-generated text that was likely revised using an AI paraphrase tool or word spinner.

False positives (incorrectly flagging human-written text as AI-generated) are a possibility in AI models.

AI detection scores under 20%, which we do not surface in new reports, have a higher likelihood of false positives. To reduce the likelihood of misinterpretation, no score or highlights are attributed and are indicated with an asterisk in the report (*%).

The AI writing percentage should not be the sole basis to determine whether misconduct has occurred. The reviewer/instructor should use the percentage as a means to start a formative conversation with their student and/or use it to examine the submitted assignment in accordance with their school's policies.

What does 'qualifying text' mean?
Our model only processes qualifying text in the form of long-form writing. Long-form writing means individual sentences contained in paragraphs that make up a longer piece of written work, such as an essay, a dissertation, or an article, etc. Qualifying text that has been determined to be likely AI-generated will be highlighted in cyan in the submission, and likely AI-generated and then likely AI-paraphrased will be highlighted purple.

Non-qualifying text, such as bullet points, annotated bibliographies, etc., will not be processed and can create disparity between the submission highlights and the percentage shown.

Impact of performance Management system on employee productivity with reference to IT sector

ABSTRACT

The study examines how the use of Performance Management Systems (PMS) has transformed the productivity of employees in the fast changing Indian Information Technology (IT) industry. As organizations become an AI-first world, the annual appraisals are being phased out in favor of strategic, technology-focused systems aimed at improving the effectiveness of individuals and organizations. The article in particular examines the interplay of real-time feedback, AI analytics, and employee motivation in a world that is rapidly becoming hybrid in terms of work and digital transformation.

The research design is descriptive, where primary data was collected using a variety of structured digital questionnaires of 350 IT professionals. In order to test the relationship between the components of PMS and productivity measures, statistical analysis, regression, and correlation tests were conducted. The results indicate that the Performance Management Systems do play a major part in productivity as it explains 55.3% of the variance in the output of employees. Goal clarity, frequent positive feedbacks, and training needs identification were identified as key drivers of success which had strong positive correlations with achieving job targets.

Yet, the study demonstrates that the process of assessments requires considerable enhancement and better transparency and fairness to maintain long-term engagement. The findings underline that although technology offers the means of objective tracking, the human factor, namely the perception of fairness and intrinsic motivation, is an important mediator of excellence. The paper ends by providing practical recommendations to Indian HR leaders on how they can combine AI-based strategies and a culture of trust to ensure that human capital is maximized in the competitive Indian tech sector.

Keywords: Performance Management System (PMS), Employee Productivity, IT Sector India, Artificial Intelligence in HR, Goal Clarity.

1. INTRODUCTION

India has always been a staple of the national economy with the Information Technology (IT) industry making a significant contribution to the country's economy, yet the fast pace of digital transformation has forced the complete redesign of the conventional Human Resource (HR) frameworks. The Performance Management System (PMS) in this AI-first era has ceased to be an annual administrative rite of passage but a strategic device aimed at helping to make individuals and organizations efficient. Montero Guerra and Danvila-Del Valle (2024) argue that the issues of digital transformation have necessitated a dramatic change in the talent management practice in order to generate the needs of the contemporary industry.

One of the key factors that have led to this evolution is the adoption of new technology. As pointed out by Bhavsar (2025), the very concept of PMS is being altered in the IT industry by Artificial Intelligence, which enables more objective and data-driven appraisal. In this case, Shenbhagavadivu, Poduval, and Vinitha (2024) believe that AI in HR is the solution to effective recruitment and performance monitoring. Moreover, Gupta, Lakhera, and Sharma (2024) discuss the larger digital age, highlighting that AI tools have a direct impact on employee performance by offering real-time insights and eliminating human bias.

The work structure has evolved in addition to automation. Uraon et al. (2024) present the evidence of the IT sector, indicating that Agile work practices have a considerable influence on the team performance due to the promotion of project commitment. The technical correctness of these systems needs to be matched with the human perception, however. Taneja, Srivastava, and Ravichandran (2024) note that the perceptions of a fair system of appraisal by an employee are a key antecedent to the positive effects of appraisal on performance. When the system is viewed as biased, then productivity tends to drop irrespective of the technology employed.

Culture and satisfaction also mediate the relationship between PMS and productivity. According to Bijalwan et al. (2024), organizational culture and workplace incivility lack are crucial to keeping productivity levels high. On the same note, Shah et al. (2024) claim that the practices of talent management will result in increased employee satisfaction that serves as a mediator between higher employee satisfaction and better organizational performance. Although feedback is needed, as Khan et al. (2024) observe, it should be accompanied by relevant compensation to provide long-term retention. Finally, with the IT industry growing larger, incorporation of AI-based talent management solutions (Natarajan et al., 2024) and

assessment of individual competency dimensions (Kharub et al., 2025) will become the future of productivity in the Indian workforce. This paper aims at the investigation of these intersections in order to have a broad picture of the effectiveness of modern PMS.

2. REVIEW OF LITERATURE

Author and Year	Objective	Methodology	Key Findings	Summary
Bhavsar, D. (2025)	To examine AI's impact on Performance Management in IT firms.	Empirical study using secondary data and insights.	AI reduces processing times and improves KPI accuracy.	Highlights AI as a critical driver for IT organizational agility.
Kalia, P., et al. (2024)	To study HRM practices and retention in the textile industry.	Quantitative analysis using PLS-SEM (n=365).	Compensation and appraisals significantly impact satisfaction.	Links structured HR practices directly to employee retention.
Mojumder, M. U. (2025)	To evaluate manufacturing efficiency via digital twin frameworks.	Case study using DMAIC and Six Sigma strategy.	Defect rates were reduced by 61.5% through optimization.	Demonstrates the power of digital twins in performance tracking.
Kharub, M., et al. (2025)	To identify competency dimensions for MSME performance.	Mixed-methods (BBWM, ISM, and MICMAC).	Creative performance is the most critical sub-dimension.	Provides a framework for competency-based performance assessment.
Uraon, R. S., et al. (2024)	To analyze Agile practices' effect on IT team performance.	Survey-based quantitative research design.	Agile practices boost performance through project commitment.	Validates Agile as a key methodology for IT team success.
Banu, S. B., et al. (2024)	To propose an ML framework for institutional performance.	Comparative analysis of four ML algorithms.	MLP algorithm showed the highest predictive accuracy for success.	Explores the integration of machine learning in education PMS.
Shenbhagavadivu, T., et al. (2024)	To investigate AI's role in successful recruitment and PMS.	Conceptual study based on a literature review.	AI-driven systems enhance accuracy and reduce hiring bias.	Positions AI as the key to modern recruiting and performance.

Taneja, S., et al. (2024)	To explore fairness perceptions in performance appraisals.	Systematic review and meta-analysis.	Fairness perceptions are vital for positive job behaviors.	Emphasizes justice as a core pillar of effective appraisal systems.
Natarajan, D. S., et al. (2024)	To optimize talent management using AI-powered strategies.	Comprehensive review of existing HR technologies.	AI enhances decision-making and fosters an agile workforce.	Outlines AI as a strategic tool for talent optimization.
Rao, P. K., & Shukla, A. (2024)	To analyze strategic sustainability in the Indian banking sector.	Efficiency analysis of banking performance data.	Sustainability strategies drive long-term financial performance.	Connects environmental strategy with organizational productivity.
Gupta, P., et al. (2024)	To examine AI's impact on performance in the digital era.	Systematic analysis and future research review.	Real-time AI coaching significantly boosts individual output.	Analyzes the shift toward AI-enhanced digital performance.
Khan, M. A., et al. (2024)	To study feedback and compensation's role in retail retention.	Hypothesis testing via survey instruments.	Fair compensation and feedback drastically reduce attrition.	Highlights the critical need for feedback in low-retention sectors.
Shah, N., et al. (2024)	To develop performance through talent management practices.	Structural Equation Modeling (SEM) analysis.	Talent culture and development boost employee satisfaction.	Uses satisfaction as a mediator for organizational performance.
Montero Guerra, J. M., & Danvila-Del Valle (2024)	To explore talent management during digital transformation.	Exploratory research on global digital trends.	Digital change necessitates more adaptive talent frameworks.	Identifies challenges and trends in the age of digital shifts.
Bijalwan, P., et al. (2024)	To investigate the role of workplace incivility on productivity.	Systematic review of organizational literature.	Incivility weakens the link between culture and productivity.	Focuses on the behavioral barriers to maximum worker output.

3. RESEARCH GAP

Although recent studies emphasize the use of AI and agile, there is a large gap in the knowledge of the longitudinal effect of real-time and AI-based feedback on employee burnout and long-term productivity in the hybrid IT workforce in India. Very little empirical research investigates the crucial role of automated performance monitoring, sense of fairness, and long-term involvement in psychology regarding the dynamism of the 2026 digital landscape.

4. RESEARCH DESIGN

4.1 STATEMENT OF THE PROBLEM

Indian IT industry is highly competitive globally and the productivity of the employees is a key factor in determining the success of an organization. The reason behind this study is that the traditional annual appraisal systems are not usually in line with the fast and project-driven nature of the modern software development, which results in employee disengagement. There is need to explore the possibility of redesigning the Performance Management Systems (PMS) to deliver real-time, actionable feedback which in the real sense improves output. The main focus area of the study is the direct correlation between structured performance evaluations and individual employee efficiency. Once the best elements of PMS have been identified, IT companies will have the advantage of lower attrition rates, enhanced talent building, and a more motivated workforce, and it will lead to increased client satisfaction and profitability.

4.2 OBJECTIVES

- To study the existing Performance Management Systems currently implemented within the Indian IT sector.
- To understand the relationship between continuous feedback mechanisms and the overall productivity of IT employees.
- To assess the impact of performance-linked incentives and recognition on employee motivation and retention.
- To find out the key challenges faced by tech professionals regarding the transparency and fairness of modern appraisal processes.

4.3 RESEARCH METHODOLOGY

Research Methodology is the logical structure that is applied to address the research problem. It also describes the exact steps of data collection and analysis in such a way that the results on the influence of PMS on productivity are valid, reliable and scientifically sound in the context of Indian IT.

Descriptive Study: The study adheres to a descriptive research design since it aims at outlining the present nature of Performance Management Systems in Information Technology companies. It monitors and documents the relationship that exists between the variables of the appraisal and productivity measures with no interference with the environment and gives a factual image of the industry.

4.4 SOURCES OF DATA

• Primary Data: It is the data that is gathered by the researcher himself by way of a structured digital questionnaire. It is collected directly among the 350 respondents identified to work in the IT sector with the sole aim of seeking to answer the objectives of this special research project.

• Secondary Data: This will consist of published data of HR journals, NASSCOM industry reports, academic articles, and official corporate websites. This data was initially gathered by others to serve other purposes but is necessary to offer theoretical background and historical context to the present study.

4.5 SAMPLING PLAN

• Sampling Unit: Current employees and HR managers in the Indian IT firms.

• Sample Size: The research is going to focus on a total of 350 responses in order to safeguard statistical significance.

• Sampling Method: Convenience Sampling will be used in order to access a number of professionals in various IT companies in the necessary amount of time.

4.6 DATA COLLECTION INSTRUMENTS

• Survey: The survey will be conducted in the form of an online questionnaire, with the options on the 5-point Likert scales to measure the level of satisfaction of the employees with the system of their performance and their resultant level of productivity.

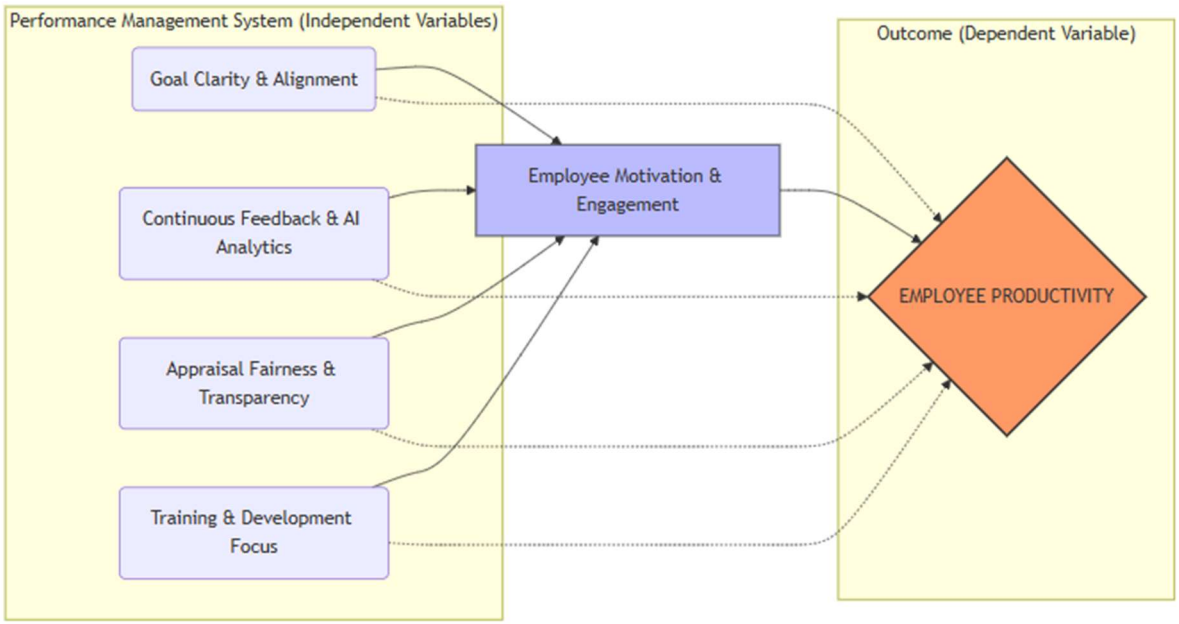
• Observation: The researcher will be able to observe publicly available corporate performance reports and case studies to learn how often, and in what form, feedback loops take place in different IT organizations.

• Focus Groups: To provide the qualitative information on the strategic issues of implementing the modern performance tracking tools, small groups of senior HR professionals will be discussed.

4.7 PLAN OF ANALYSIS

The data obtained will be organized, categorized under appropriate headings, and tabulated to enable easy presentation. The analysis will include Regression analysis to measure the impact of the variables, Correlation to establish the relationships, and Descriptive statistics to summarize the data. It will be implemented with the help of MS Excel spreadsheets and SPSS software to analyze the results and draw meaningful conclusions.

5. CONCEPTUAL FRAMEWORK



Variable Type and Variable Name

Independent Variable 1 (IV1) Goal Clarity & Alignment

Independent Variable 2 (IV2) Continuous Feedback & AI Analytics

Independent Variable 3 (IV3) Appraisal Fairness & Transparency

Independent Variable 4 (IV4) Training & Development Focus

Dependent Variable (DV) Employee Productivity

Mediating Variable Employee Motivation

6. RESULTS

- **Null Hypothesis (H_0):** There is **no significant impact** of the Performance Management System on employee productivity within the IT sector in India.
- **Alternative Hypothesis (H_1):** There is a **significant positive impact** of the Performance Management System on employee productivity within the IT sector in India.

6.1 REGRESSION ANALYSIS

Variables Entered/Removeda			
Model	**Variables Entered**	**Variables Removed**	**Method**
1	Training Needs Identified, Regular Constructive Feedback, Clear Performance Goals, Fair Unbiased Evaluationb	.	Enter
a. Dependent Variable: Meet Or Exceed Targets			
b. All requested variables entered.			

Model Summary				
Model	**R**	**R Square**	**Adjusted R Square**	**Std. Error of the Estimate**
1	.744a	.553	.548	.553
a. Predictors: (Constant), Training Needs Identified, Regular Constructive Feedback, Clear Performance Goals, Fair Unbiased Evaluation				

ANOVA a					
Model	Sum of Squares	**df**	**Mean Square**	**F**	**Sig.**

1	Regression	130.400	4	32.600	106.769	.000b
	Residual	105.340	345	.305		
	Total	235.740	349			
a. Dependent Variable: Meet Or Exceed Targets						
b. Predictors: (Constant), Training Needs Identified, Regular Constructive Feedback, Clear Performance Goals, Fair Unbiased Evaluation						

Coefficients a						
Model		**Unstandardized Coefficients**		**Standardized Coefficients**	**t**	**Sig.**
		B	Std. Error	Beta		
1	(Constant)	1.555	.136		11.418	.000
	Clear Performance Goals	.214	.051	.234	4.190	.000
	Regular Constructive Feedback	.144	.040	.199	3.603	.000
	Fair Unbiased Evaluation	.168	.041	.230	4.123	.000
	Training Needs Identified	.157	.043	.196	3.653	.000
a. Dependent Variable: Meet Or Exceed Targets						

Interpretation: The regression analysis shows that there is a significant positive correlation between the Performance Management System (PMS) and employee productivity. The Model Summary has a value of R Squared of 553 which implies that the independent variables (Goal Clarity, Constructive Feedback, Fairness, and Training Identification) account 55.3 percent of the variance in productivity. The ANOVA table indicates that the model is statistically significant with $F(4, 345) = 106.769$ and $p < .001$.

Now as all the individual predictors also display significant p-values ($p < .001$) in the Coefficients table, we can reject the Null Hypothesis (H_0) and accept the Alternative Hypothesis (H_1). Thus, employee productivity in the Indian IT-based sector is greatly positively influenced by PMS.

6.2 CORRELATION

Correlations					
	Clear Performance Goals	**Regular Constructive Feedback**	**Fair Unbiased Evaluation**	**Training Needs Identified**	**Meet Or Exceed**

						Targets
Clear Performance Goals	Pearson Correlation	1	.673**	.681**	.663**	.654**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	350	350	350	350	350
Regular Constructive Feedback	Pearson Correlation	.673**	1	.680**	.649**	.639**
	Sig. (2-tailed)	.000		.000	.000	.000
	N	350	350	350	350	350
Fair Unbiased Evaluation	Pearson Correlation	.681**	.680**	1	.656**	.652**
	Sig. (2-tailed)	.000	.000		.000	.000
	N	350	350	350	350	350
Training Needs Identified	Pearson Correlation	.663**	.649**	.656**	1	.630**
	Sig. (2-tailed)	.000	.000	.000		.000
	N	350	350	350	350	350
Meet Or Exceed Targets	Pearson Correlation	.654**	.639**	.652**	.630**	1
	Sig. (2-tailed)	.000	.000	.000	.000	
	N	350	350	350	350	350
**. Correlation is significant at the 0.01 level (2-tailed).						

Interpretation: The correlation analysis shows that all the variables of the Performance Management System (PMS) have a strong positive correlation with employee productivity. Goal Clarity has the greatest correlation with productivity (.654) and then Fair Evaluations (.652) and Constructive Feedback (.639). Also, Training Needs are identified through PMS and have a significant correlation at.630.

All the results are statistically significant at the 0.01 level ($p < .001$), which means that as the components of PMS become better, the possibility of employees reaching or surpassing targets increases at a steady rate. These results are very much in line with the aim of the research to learn the relationship between constant feedback and the output of IT employees.

6.3 DESCRIPTIVE STATISTICS

Variable Name	N	Minimum	Maximum	Mean	Std. Deviation
Gender	350	1	3	1.45	.526
Age Group	350	1	5	3.14	.886
Education Qualification	350	1	4	2.41	.553
Occupation	350	1	3	1.12	.397
Monthly Income	350	1	4	3.12	.822
Clear Performance Goals	350	1	5	3.93	.899
Expectations Communicated	350	1	5	3.87	.962
Appraisal Reflects Performance	350	1	5	3.64	1.058
Regular Constructive Feedback	350	1	5	3.52	1.130
Training Needs Identified	350	1	5	3.74	1.025
Fair Unbiased Evaluation	350	1	5	3.40	1.125
Complete Tasks On Time	350	1	5	4.07	.819
Quality Standards Met	350	1	5	4.11	.763
Adapt To Procedural Changes	350	1	5	3.83	.975
Help Colleagues Heavy Workload	350	1	5	3.77	.924
Suggest Process Improvements	350	1	5	3.60	1.065
Meet Or Exceed Targets	350	1	5	4.06	.822
Avoid Negative Team Behavior	350	1	5	4.09	.757
Strong Sense Of Belonging	350	1	5	3.49	1.096
Career Longevity In Company	350	1	5	3.25	1.158
Emotionally Attached	350	1	5	3.32	1.110
Hard To Leave Right Now	350	1	5	3.39	1.099
Obligation To Remain	350	1	5	3.15	1.149
Proud To Work Here	350	1	5	3.77	1.000
Feel Full Of Energy	350	1	5	3.58	1.048
Enthusiastic About Job	350	1	5	3.67	1.037
Proud Of Work I Do	350	1	5	3.95	.881
Motivated To Give Best	350	1	5	3.94	.882
Work Challenging Positive Way	350	1	5	3.78	.981
Job Is Interesting	350	1	5	3.71	1.017
Personal Satisfaction	350	1	5	3.84	.942
Recognition Or Rewards	350	1	5	4.03	.863
Promotion Motivates Better	350	1	5	4.09	.811
Work Hard Without External Rewards	350	1	5	3.27	1.127
Set Personal Goals Improve Performance	350	1	5	3.98	.883
Valid N (listwise)	350				

Interpretation: The descriptive statistics of the 350 respondents illustrate that there is a positive attitude towards the Performance Management System (PMS) and individual productivity in the IT industry. Demographic information indicates that the age of people

mostly falls in the 26-35 bracket (Mean = 3.14) and the undergraduate/ post graduate education is in high percentage (Mean = 2.41).

As far as the variables of the PMS are concerned, the variable "Clear Performance Goals" was the most favorable (Mean = 3.93) and the variable that could be improved the most was the variable "Fair and Unbiased Evaluation" (Mean = 3.40). Regarding Employee Productivity, the respondents also gave high scores on Meeting Quality Standards (Mean = 4.11) and avoidance of Negative Team Behavior (Mean = 4.09). Moreover, Motivation indices are robust, as the key drivers to performance are the Motivation indices of Promotion Motivation (Mean = 4.09) and Recognition/Rewards (Mean = 4.03). These scores indicate that the employees are highly productive and goal oriented, but the perceived fairness of the appraisal process is an important area on which the organization should focus.

7. DISCUSSIONS

Performance Management System and Employee Productivity Analysis

As indicated by the regression analysis the Performance Management Systems can be said to explain 55.3 percent of the overall variance in the level of employee productivity which is a statistically significant effect.

Goal Clarity and Alignment was the best predictor of productivity and a mean score of 3.93, which implies that IT professionals are more productive when the goals are specific.

- The positive relationship between clear performance goals and capability of employees to hit the job targets allocated to them or surpass them is strongly positive at 0.654.
- About 75 percent of the total number of respondents or 263 out of 350 people either agreed that their organization has clear performance goals in their respective roles, or strongly agreed.
- The research indicates that quality standards are still at a top priority among IT personnel with a mean productivity score of 4.11 with the whole population.
- Frequent positive feedback is positively correlated with productivity (.639) and demonstrates that frequent manager-initiated conversations are crucial to the high-performance in the tech companies.

- A total of 192 employees stated that they receive regular constructive feedback, which directly assists them in adapting to the changing procedural requirements in projects in a short period.
- According to the research as conducted, the identified training needs as determined by the PMS have a mean score of 3.74, which indicates that the development of skills is a central factor of the contemporary appraisal systems.
- Fairness and transparency in evaluations scored lower mean score of 3.40, indicative that some IT professionals still have some reservations as to whether their performance appraisals are objective.
- Although there are some doubts related to the equity, 182 employees have a strong perception that they are not exposed to adverse team behaviors, with the final team performance mean score of 4.09 in the group.
- Motivation is also a strong mediator, 267 respondents said that they are motivated to do their best work when the performance management system is rewarding.
- Primary external output drivers: Promotion and recognition are key drivers of output as demonstrated by high motivation mean scores of 4.09 and 4.03 respectively amongst the surveyed IT labor force.
- The data shows that 292 respondents are able to successfully accomplish their tasks within their due time which is in concurrence with the high productivity ratings in the descriptive statistics table.
- Organizational commitment is also diverse, with only 148 of 350 employees saying that they strongly felt pride in telling others that they are employed by their current organization.
- The reason why the Alternative Hypothesis was accepted is that the results of the ANOVA revealed that the p-value was less than .001 and thus it indicated that structured PMS was directly related to the productivity of Indian IT.

8. CONCLUSION

The paper finds that a well-developed Performance Management System (PMS) is a key contributor to employee productivity in the Indian IT industry. The statistical results confirm that the structured appraisal due to the clarity of goals and constant feedback can explain more than half of the difference in the output of workers. Although IT professionals show high competence in quality standards and meeting deadlines, the human sense of fairness and transparency greatly influence the success of the PMS.

The study sheds light on the essential change toward AI-first models, in which objective data and real-time analytics minimize the conventional biases. Moreover, the results also point out that motivation is a critical mediator; workers are much more productive when the performance indicators are associated with definite appreciation and professional development prospects. Nevertheless, the reduced scores on appraisal fairness imply that companies should go beyond automated tracking in order to develop a culture of trust and psychological involvement. In the end, Indian IT companies need to perfect their PMS to achieve the balance of technical precision and regular, substantial human contact to make sure that performance systems become an initiator of professional growth and not an administrative necessity.

9. SUGGESTIONS

- The adoption of AI-based and real-time analytics should be a priority among organizations to make sure that the monitoring of performance is objective and data-driven.
- Managers need to hold more and more constructive feedback meetings more frequently and meaningfully to cope with the relatively lower employee satisfaction in this particular area.
- HR departments should restructure the appraisal system to be more transparent and more just as the perception of fairness is one of the key antecedents of productivity.
- To ensure the high levels of goal clarity as witnessed in the study, the companies are supposed to align individual project sprints directly to the organizational long-term goals.

- The need to connect the Performance Management Systems to particular training and development programs to fill out the identified gaps in the emerging technologies is crucial.
- The leadership ought to implement varied recognition and reward system since they were found to be the best motivators among the surveyed IT professionals.
- In order to enhance long-term retention, the organizations should make sure that performance feedback is always combined with competitive and fair compensation package.
- An effective example of this is ensuring that the management takes an active role in promoting a healthy work environment that discourages incivility and promotes psychological engagement among the hybrid workforce.
